EF Core Code First - Written Questions

EF01 Bookstore System Assignment

Q1. Why use Code First rather than Database First?

Code First allows developers to design the database using C# classes instead of creating tables manually in SQL Server. It makes database changes easier to manage through EF Core Migrations and keeps the database structure synchronized with the application's models. It is especially useful when developing a new application from scratch.

Q2. Why use Fluent API over Data Annotations?

Fluent API provides more flexibility and control over database configuration than Data Annotations. It allows developers to define relationships, constraints, and column types in separate configuration classes, keeping the entity models clean and organized. It is especially useful for complex database mappings.
